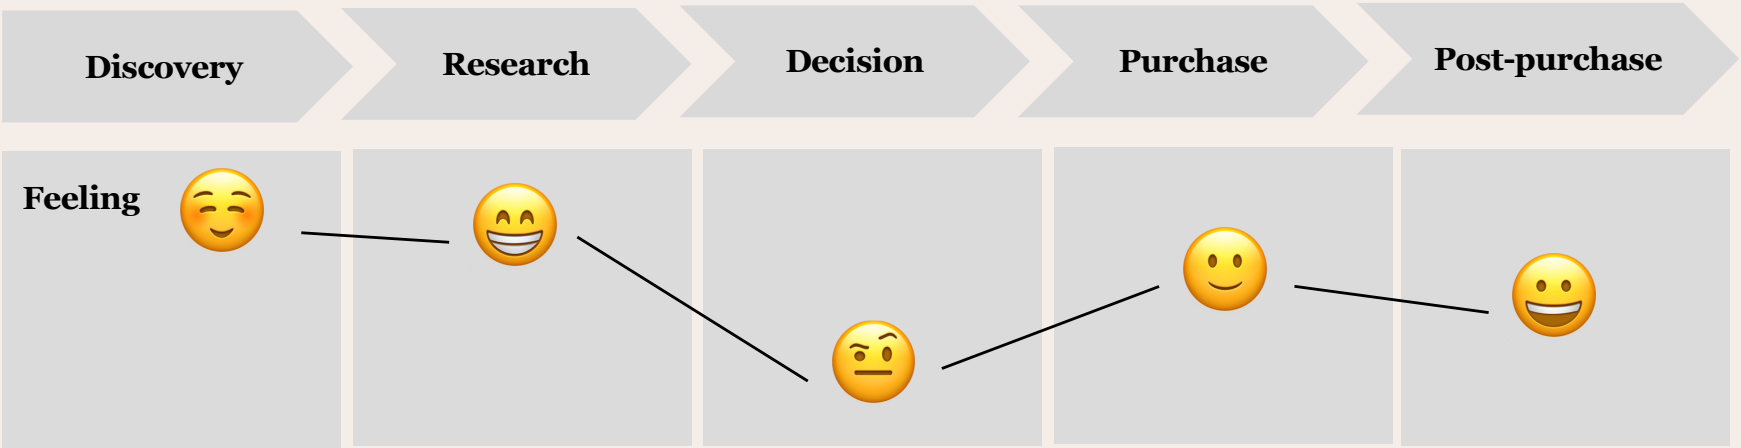
For Phia

“Imagine Me In This”

Virtual Try-On for the Price-Conscious Shopper

PARTH KOHLI· December 2025

If discovery works, what's still breaking?



Phia does a phenomenal job helping users find options. Yet many users still hesitate at decision stage. Why? The problem isn't discovery. It's decision confidence.

**According to multiple industry studies, 60-70% of users abandon carts after viewing products. If users find products, what stops them from buying*

Why does this hesitation matter for Phia?

Fashion decisions aren't purely rational.
They are emotional, identity-driven, and deeply personal.

When users can't visualize themselves:

- Decision slows down
- Hesitation increases
- Trust doesn't fully form

Even with great prices and options,
uncertainty at this stage quietly suppresses conversions and repeat usage.

I like it on the model… but I can't tell if it'll look good on me.

I want to buy it, I just don't feel sure yet

I don't want to regret this after it arrives.

I wish I could just see how it would look on me.

**40% of online fashion purchases are returned. The #1 reason is that they don't look as expected.*

What if Phia could remove that hesitation?

What if we could add a simple, optional interaction button inside the existing flow.

Try it on

"How will I look in this"

- User uploads one full body photo (head-to-toe)
- Browses products as usual
- Taps this feature to see themselves wearing the exact item.

No new app.
No detour.
And clarity at the moment when it's needed

Upload a full-body photo at onboarding

Browse any apparel using Phia's app/site

Hit "Imagine me in this" along with prices

AI imagines the exact item on the user

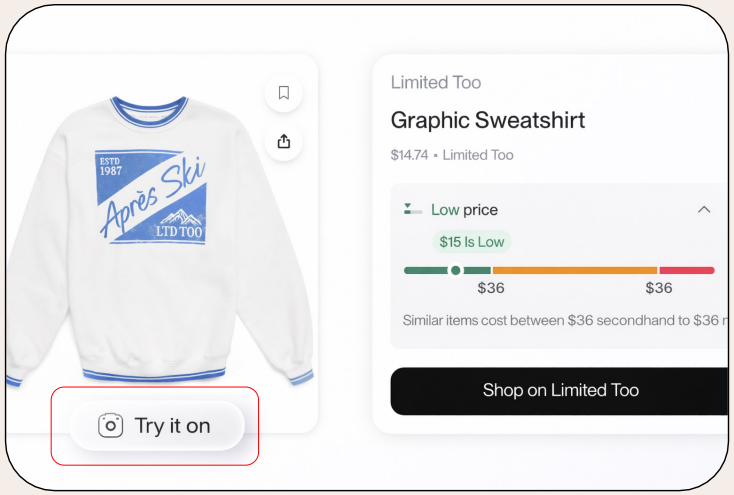
Price intelligence + visual confidence = complete shopping decision

How does this actually solve the problem?

Seeing yourself does 3 things:

- Replaces abstraction with personal context
- Turns doubt into visual confirmation
- Accelerates decision making

Instead of imaging the fit, colour and silhouette,
Users see the answer immediately!



It's about resolving the last unanswered question in the journey.

Why does Phia win at this specifically?

We already sit at a rare intersection:

- High-intent browsing
- Rich product imagery
- Structured product context
- The moment right before checkout

Thrive Capital leads — VCs betting big on AI try-on

MARKET

$367B

Global secondhand apparel by 2029

WINDOW

12-18 months

Before Google adds price comparison to Doppl

Most try-on tools lie outside the buying flow but Phia places confidence *inside* it

AND it directly aligns with the direction Phia wants to go i.e full decision making companion.

If I join Phia, here's how I'd approach this

30 days

- Deep dive into Phia's current user journey
- Identify where hesitation appears in high intent flows
- Pinpoint categories where visual confidence matters most
- Align with product, design and engineering

60 days

- Define the try-on Minimum Viable Product (MVP)
- Integrate it directly into the existing browsing flow
- Ensure the experience feels optional, lightweight, and in-flow.

90 days

- Run an A/B test against a clean control group
- Measure:
  - Time-to-decision
  - Conversion among try-on users
  - Early repeat usage
- Align design, engineering and partnerships on next step.

Price intelligence got us here.
Visual confidence takes us further.

Let's explore together

A lil bit about me!

I'm at the intersection of:

- User psychology (how people actually decide in fashion)
- Product judgment (what to test vs what to ignore)
- Business outcomes (conversion, retention, trust)
- Love for AI

I want to answer one question: Can confidence become a durable edge for Phia?

That means:

- Framing the right problem
- Keeping scope tight
- Killing the idea quickly if it doesn't earn its place

Ps currently saving to get a Rimowa :P, what about you?
